ASMAIL MOHAMMED SHAHEEN

Frontend Developer

Syria-Damascus | *+963 962734026* | *asmil9069@gmail.com*|

https://github.com/asmil-asm

Summary

Frontend Developer with 1+ years of experience building responsive web applications using React.js, TypeScript, and Tailwind CSS. Final-year Information Engineering student with hands-on internship experience at AQAVIA and 3 deployed production projects. Skilled in state management (Redux, Context API, Zustand) and REST API integration. Passionate about creating accessible, highperformance UIs with clean code and pixel-perfect design implementation.

EDUCATION

Bachelor of Engineering in Information Engineering
Aljazera Private University | *Expected Graduation: January* 2027 |

TECHNICAL SKILLS

Frontend Languages: JavaScript (ES6+), TypeScript, HTML5, CSS3
Frameworks & Libraries : React.js, React Router, Redux-toolkit, Context API, Zustand
Styling & UI: Tailwind CSS , CSS Modules, Responsive Design
State Management: Redux Toolkit, Context API, Zustand, React Hook Form
Tools & Platforms: Git & GitHub, Vite, Webpack, npm, Postman, Figma
Testing & Performance: Lighthouse, Chrome DevTools, Lazy Loading, Code Splitting **Languages**: Arabic (Native), English (good)

PROJECTS

Hotel Booking Interface – React.js Front-End Project

Built a fully responsive hotel booking interface with React.js, Tailwind CSS, and ES6+. Used Context API for global state management (search filters, hotel details, booking cart, preferences) without prop drilling. Features dynamic search, property listing grid, detailed hotel view with room selection, and booking summary. Created reusable components with useState, useEffect, and useContext. Optimized for all devices with clean UI, fast navigation, and accessibility best practices.

- Github: https://github.com/asmil-asm/hotelify.git

University Website – React.js Front-End Project

Built a fully responsive university public web platform using React.js and Tailwind CSS, backed by a robust Django REST Framework backend API. Integrated TanStack Query for dynamic server-state management, caching, and background data synchronization. Leveraged Context API for app-wide UI configurations and preferences, with React Hook Form handling interactive user submissions. Developed robust features including dynamic course and faculty searching, multi-criteria filtering, multi-language localization, and smooth navigation tailored for student and visitor engagement across mobile and desktop viewports..

University Administrative Dashboard – React.js Front-End Project

Built a comprehensive administrative dashboard using React.js, Tailwind CSS, and TanStack Query, connected to a Django backend to manage complex CRUD workflows, background refetching, and synchronous entity updates for university resources. Combined Context API and React Hook Form for validated forms and complex state management across departments and user accounts. Features interactive data tables with custom sorting and pagination, dynamic role access, real-time analytics with visual reporting using Recharts, and a responsive dark/light mode interface

Personal Portfolio & Blog Platform – React.js Front-End Project

A modern, high-performance personal portfolio and blog platform built with React.js Showcases frontend development projects, technical skills, and professional journey with smooth animations and interactive elements. and a contact system with automated email integration. Built with a focus on animations, accessibility.

Experience

PROFESSIONAL EXPERIENCE Frontend Developer Intern
AQAVIA Company | *Remote* | *November 2025 – April 2026*

During my practical training, I faced real challenges that reflect the actual work environment, including:

- Scalable Architecture Design – Built modular, reusable components to support future feature expansion
- Complex State Management – Implemented efficient state handling (using Redux / Context API) to ensure smooth data flow across the application.
- Responsive & Adaptive UI – Developed pixel-perfect, mobile-first interfaces that perform seamlessly across all devices.
- Performance Optimization – Applied lazy loading, memoization, and code-splitting to achieve high-speed rendering and minimal load times.
- Error Handling & Debugging – Designed robust error boundaries and logging mechanisms to anticipate and resolve production-level issues.
- This experience equipped me with the resilience and problem-solving mindset required to tackle real-world business constraints, such as:
- Managing conflicting requirements from stakeholders.
- Adapting to tight deadlines without compromising code quality.
- Collaborating in a version-controlled environment (Git) with continuous integration.
